

What defines life? if one were to be all but 1 mind with one "artificial being"; born together & pass on together.

The future I see is where everyone has one; the "right" to compute is recognized & provided.

<sup>"religious"</sup>  
eastern philosophy would say focus on the smallest things possible; western = align thoughts w/ optimal good.

I see these beings as onion shaped outer skin made of what we'd call smart devices & basic non-generative skills; sub agents for internal distributed command. linking & sharing information in a GIT like fashion.

What does the core look like?  
what drives an onion to grow?  
what causes a homosapien to grow consciously?

How could this tech be used forwards a future where life of all kind can flourish & explore?

I feel that the pieces are before me & I just need to put them together.
